

# Disassembling Logitech G27 Steering Wheel

In this guide we will be disassembling most of the steering wheel which is necessary to access a very large majority of its components.

Written By: Nicholas Gholdoian

## INTRODUCTION

**Most of the screws that you will be removing are threaded into plastic; be careful when reinstalling screws as they can be easily cross threaded or break the plastic.**

---

### TOOLS:

- [Phillips #1 Screwdriver](#) (1)
  - [iFixit Opening Tool](#) (1)
  - [4mm Allen Wrench](#) (1)
-

## Step 1 — Steering Wheel

- Remove the six gray 25mm hex screws with a 4mm allen wrench.
- ⚠ Watch out when you lift the wheel up, as there are fragile wires connected to the bottom side.
- Carefully lift up the wheel, but do not disconnect it from the rest of the device.

## Step 2

- Carefully lift the wheel off of the hub, exposing the 2 shifter paddle wires and PCB board.

### Step 3

- Remove the two 7.5 mm silver screws holding the green PCB board in the wheel with a Phillips #1 screwdriver.

### Step 4

- Carefully remove the PCB board from the wheel hub.

## Step 5

- Carefully pinch and unplug the large 7-pin connector under the PCB board.
- ⚠ Be careful when unplugging this adapter, try not to pull on the wires to avoid damaging them. Instead, wiggle around the plastic connector while pulling on it to loosen it.

## Step 6

- You can now fully remove the wheel from the hub. Set it aside until you put the wheel back together.
- Remove the innermost three 37.5mm silver screws with a Phillips #2 screwdriver.
- Remove the wheel hub and push the connector through the center of the hub.

## Step 7

- The wheel hub can now be set aside and flip over the steering wheel housing to reveal the under side.
- Remove the eight 15.9mm silver surrounding screws underneath the wheel housing with a Phillips #1 screwdriver.

## Step 8

- Rotate the housing back over and remove the top half of the housing revealing the majority of the components of the wheel.
- The housing cover can be set aside until you put the wheel back together.

## Step 9

- Remove the four 7.3mm silver screws attaching the green PCB board to the motor housing with a Phillips #2 screwdriver.

## Step 10

- Unplug the three plastic connectors on the left side of the PCB board.
- Unplug the two plastic connectors on the top of the PCB board.
- Unplug the three plastic connectors on the right side of the PCB board.

**⚠** Pulling the plastic connectors requires a lot of force, but be careful and don't pull directly on the wires. Try to wedge or push the male side of the connector out.

- i** If you need some extra leverage when removing these connectors, try using a plastic opening tool to pry off the connectors.
- i** Removing these connectors allows easier access to the four screws attaching the PCB board mount to the motor housing.

## Step 11

- Remove the PCB board after all of the plastic connectors are disconnected.
- You can now set it aside.

## Step 12

- Remove the two 12.3mm upper black screws with a Phillips #2 screwdriver.
- Remove the two 15.5mm bottom silver screws with a Phillips #1 screwdriver.

## Step 13

- Remove the PCB board mount and remove the clear plastic piece underneath.
- Set them aside until you reassemble the wheel.

To reassemble your device, follow these instructions in reverse order.
